EXPERIMENT 1

Setting Up the Python Environment and Libraries – Jupyter Notebook

AIM

To set up a Python notebook environment, execute basic Python code, and create separate code and Markdown cells in Jupyter Notebook.

PROCEDURE / ALGORITHM

1. Install Python and Jupyter Notebook, or open Jupyter through an available Python distribution.

2. Launch Jupyter Notebook and create a new Python 3 notebook.

3. Enter a simple Python statement in the first code cell.

4. Run the cell using Shift + Enter and observe the output.

5. Insert another cell, change its type to Markdown, and enter a heading or short note.

6. Run the Markdown cell to display the formatted text, then save the notebook.

PROGRAM

```
# First Python notebook cell
name = "Social Media Data Analytics"
print("Hello, Python!")
print("Project:", name)

# Basic calculation
a = 10
b = 20
print("Sum =", a + b)
```

OUTPUT

```
Hello, Python!
Project: Social Media Data Analytics
Sum = 30
```

The output confirms that the notebook cell executed successfully and displayed the expected text and calculation.

RESULT

The Python notebook environment was set up, and basic Python statements were executed successfully. Code and Markdown cells were used to organise notebook content.
