POWER BI DASHBOARD FOR RETAIL SALES ANALYSIS

1. Aim

To import a retail sales dataset into Microsoft Power BI, create key performance indicators and charts, and assemble them into an interactive dashboard for analysing revenue, profit, units sold and customer ratings.

2. Algorithm

1. Open Power BI Desktop and select **Get Data** → **Excel workbook**.

2. Load the worksheet **RetailSales** from **Experiment_6_Retail_Sales_Dataset.xlsx** and select **Transform Data** if data types need checking.

3. Confirm that Month, Region and Product are text fields; Units_Sold, Revenue and Profit are numeric; Customer_Rating is decimal.

4. Select **Close & Apply** to load the data into the report.

5. Create four Card visuals for Total Revenue, Total Profit, Units Sold and Average Customer Rating.

6. Create a line chart for monthly revenue, a bar chart for units sold by product, a bar chart for revenue by region, and a pie chart for profit by product.

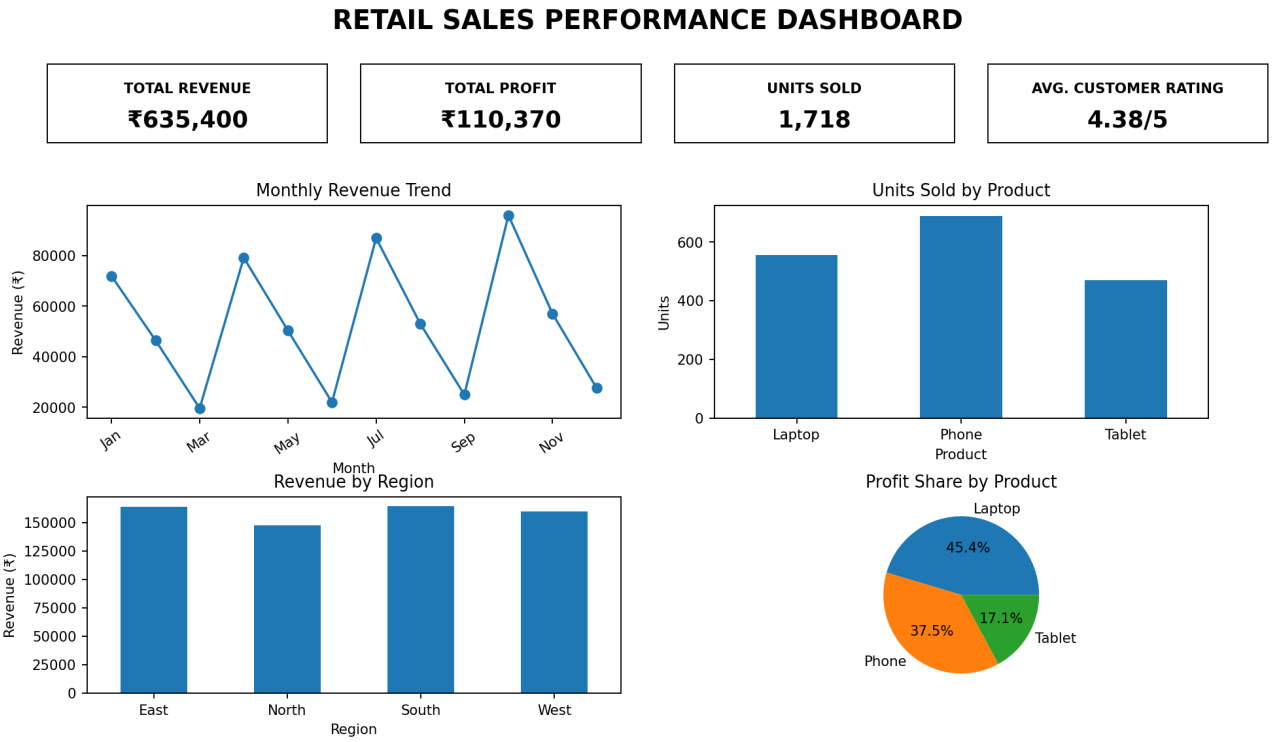

7. Add slicers for Region and Product so users can filter the dashboard.

8. Arrange and resize the visuals, add clear titles, and format currency and rating values.

9. Save the report as **Experiment_6_Retail_Sales_Dashboard.pbix**.

3. Output – Dashboard Layout

The image below is a sample dashboard layout created from the separate retail sales dataset. Recreate the same visuals in Power BI Desktop for the actual .pbix output.

4. Interpretation

From this dataset, total revenue is ■635,400, total profit is ■110,370, and 1,718 units were sold. The average customer rating is 4.38 out of 5. The dashboard allows users to compare monthly revenue, product sales, regional revenue and product-wise profit.

5. Result

Thus, a retail sales dashboard layout was designed using a separate sample dataset, with KPI cards and charts suitable for implementation in Microsoft Power BI.
